

Figure 1: The 10 essential public health services 2010

Figure 2: The 10 essential public health services 2020

Here's a comparison of the two graphics on The 10 Essential Public Health Services from 2020 and 2010:

1. Central Focus and Core Philosophy

The most notable difference between the 2020 and 2010 graphics is their core focus. The 2020 version places "Equity" at the very center, signifying a strong commitment to addressing systemic health disparities caused by poverty, racism, and other social determinants. This modern framework recognizes that achieving health equity is not just a goal but a guiding principle for all public health services. In

contrast, the 2010 version centers on "System Management" and "Research", reflecting a more traditional public health model focused on infrastructure, data systems, and administrative processes.

2. Emphasis on Equity and Inclusion

A key advancement in the 2020 graphic is the explicit acknowledgment of systemic and structural barriers to health, such as racism and gender discrimination. By placing equity at the center, the graphic makes it clear that all services must work toward fairness and justice in health access and outcomes. This level of emphasis is not present in the 2010 version, which does not mention equity directly and instead focuses more on functional delivery and management of services.

3. Structural Organization of Services

While both graphics organize the 10 essential services under the same three core functions—Assessment, Policy Development, and Assurance—the 2020 version groups the services more fluidly and contextually. It also emphasizes ongoing innovation, evaluation, and workforce development. The 2010 model is more rigid in structure and distinctly separates each service in a circular flow, emphasizing hierarchy and process. The newer model's layout conveys a more interconnected, systems-thinking approach.

4. Role of Research and Evaluation

In the 2010 framework, research and system management are placed at the heart of the model, indicating that data-driven decision-making and coordination were central priorities. In the 2020 framework, research is not visually central but is still emphasized under "Improve and innovate through evaluation, research, and quality improvement." This shift reflects a broader, integrated approach where research supports equity and innovation, rather than being the driving core.
